- Update KB of Macintosh compliance that you need to:
 - add a dummy product with dummy check
 - Define compliance check of the dummy product for the relevant devices (based on OS,etc)
- Product Manager:
 - Create MAC OS compliance check as part of product instead of script (similar to Windows). It was a nightmare to configure and debug it
 - Unreachable should be different from rogue (notify but do not raise red color as in many cases it is fine and just needs checking)
 - AD integration - be able to define policy based on AD group or OU without creating a group manually in Portnox (due to large number of groups used)
- Blum to create a ticket with Ron for the failure to check all devices within an AD group
 - 14 users is working but another with over 80 does not
